Task Sheet No. 1:
ACTION RESEARCH DATA BANK

INSTRUCTION:

As a group emerging teacher-researcher, you are task to develop an **Action Research Data Bank** based on actual observations and experiences during your Field Study and from the latest review or related literatures (RRL)/published action research. You will identify, document, and organize potential **classroom-based and school-based problems or concerns** that may serve as possible topics for future action research. It may be related to different classroom situations, teaching practices, learner behaviors, instructional strategies, assessment practices, and school-related concerns that you encountered. Some of these situations may indicate a gap, difficulty, recurring problem, or opportunity for improvement that can be addressed through action research. Your observations must be based on **actual Field Study experiences** and should not be based solely on assumptions or hypothetical situations. Your output will be submitted to your Field Study Instructor/Professor and may be used as a reference when developing a future Classroom-Based Action Research (CBAR) proposal.

RUBRIC FOR GRADING:

CRITERIA	EXCELLENT	PROFICIENT	DEVELOPING	BEGINNING
Thematic Area and Context (20%)	Clearly identifies an appropriate thematic area and provides a specific, relevant, and well-contextualized description of the classroom/school situation where the concern was observed.	Identifies an appropriate thematic area and provides a clear description of the relevant classroom/school context.	Identifies a thematic area and provides a general context, but important details or connections are lacking.	The thematic area or context is unclear, inappropriate, not connected or missing.
Identification of Research Concerns/Problem (25%)	Identifies 10 or more specific, relevant, and clearly researchable concerns/problem based on actual Field Study experiences and RRL	Identifies at least 8-10 relevant concerns/problem and RRL, with most being specific and potentiality.	Identifies at least 5-7 concerns and/or RRL and several concerns/problem are broad, unclear, or difficult to research.	Identifies less than 5 concerns/problem and RRL, which are mostly vague, unrelated, or not researchable.
Identification and Analysis of the Problem, Solution, and Outcome (25%)	Clearly identifies a specific and observable educational concern and provides thoughtful analysis of its possible causes, solution, and effects.	Clearly identifies the concern and provides an adequate explanation of its possible causes, solution, or effects.	Identifies the concern, solution, and outcome but provides limited analysis or relies mainly on description.	Concern, solution, and outcome is vague, unsupported, or difficult to identify.
Alignment of Components (20%)	Demonstrates strong and logical alignment among the thematic area, context, identified concern, and proposed solution/action plan.	Shows clear alignment among most of the required components but not all.	Shows partial alignment, with some inconsistencies among the components.	Components are disconnected or demonstrate little logical relationship.
Organization and Completeness (10%)	All required components are complete, logically organized, coherent, and presented clearly.	Required components are complete and generally well organized.	Some components are incomplete or inconsistently organized.	Several required components are missing or poorly organized.

Suggested Proposal Title	The Effectiveness of a "Praise and Token" System in Reducing Minor Disruptive Behaviors Among Grade 10 Students in Pres. Diosdado Macapagal High School
Research Agenda or Thematic Area/s	Teaching and Learning
Research Focus	Instruction and Learners
Name of Proponents	Coronejo, John Brix G. - BTVTEICT-CP-4D Ferrer, Emmanuel P. - BTVTEICT-CP-4D Wales, Aliah T. - BTVTEICT-CP-4D
Name of Adviser	Under consultation

Activity 1: Write your answer in the space provided.

Action Research Titles	Author/s (APA Format)	Thematic Area/ Context	Summary (Problem, Action Plan, and Outcome)
Example: Differentiated Instruction in teaching TLE for Grade 8 Classes		Thematic Area: Teaching and Learning Focus: Instruction Context: Describe briefly	Problem: Action/Solution: Outcome:
1. Increasing Learners' Motivation Through STAR (Student's Token for Active Response)	Taratingan, A. B., Morales, A. N., & Gomez-Rock, R. (2024)	Thematic Area: Teaching and Learning Focus: Instruction Context: The researchers implemented STAR (Student's Token for Active Response), a token-based reward system, among 35 Grade 8 learners in a public secondary school in Ozamiz City, Misamis Occidental, during the 2023–2024 school year. The intervention was designed to increase learners' motivation and active participation	Problem: The researchers identified low learner motivation as a concern. Before the implementation of STAR, the learners' motivation level was categorized as low, with a mean score of 2.23. Action: The researchers implemented the STAR token-reward system, in which learners earned star stickers for active participation and correct responses. The accumulated stars could be exchanged for corresponding prizes.

		in classroom activities. Learners received star stickers for active participation and correct responses, which could later be exchanged for corresponding rewards	Outcome: After the implementation of STAR, the learners' motivation level increased from low (M = 2.23) to high (M = 4.03), with a statistically significant difference between the pre- and post-implementation results. The researchers also observed increased learner interest and confidence.
2. The Use of a Token Economy to Help Motivate Students	Hudachek, S. (2021)	Thematic Area: Teaching and Learning Focus: Instruction Context: The study was conducted by a special education teacher who implemented a token economy intervention with her students over a seven-week period. The intervention was introduced and implemented daily to encourage students to demonstrate appropriate classroom behaviors and reduce disruptive and noncompliant behaviors. The study took place during the COVID-19 pandemic, which affected the consistency of the school year.	Problem: The researcher identified disruptive and noncompliant student behaviors as a classroom concern. Action: A token economy intervention was implemented for seven weeks. Students received tokens for appropriate behaviors, which were used as a form of reinforcement. Outcome: The results showed inconsistent effects. The token economy demonstrated potential in reducing some disruptive and noncompliant behaviors, but the findings were affected by disruptions associated with the COVID-19 pandemic. Therefore, the intervention did not provide a consistent

			result across the measured behaviors.
3. Token Economy: Reducing Undesirable Behavior Among the Grade 6 Pupils Through the Use of a Reward System	Bio, J. P., Bu-agan, N. M., Jabagat, C. J. U., Lomo, F. J. M., Lopez, R. L. G., & Mabalo, M. J. A. (2023)	Thematic Area: Teaching and Learning Focus: Instruction Context: The researchers conducted a classroom-based action research study involving 41 Grade 6 pupils. The study implemented a token economy/reward system using points, marbles, and stickers to encourage positive classroom behaviors and reduce undesirable behaviors among the learners.	Problem: The researchers identified undesirable and disruptive behaviors among Grade 6 pupils as a classroom concern. The study sought to determine whether a reward system could reduce these behaviors. Action: The researchers implemented a token economy reward system in which learners received points through marbles and stickers for positive behaviors. The accumulated points could be associated with rewards, while learners were also given reminders regarding the expected behaviors and goals. Outcome: The study found that there was no significant difference in learners' behavior before and after the implementation of the reward system. This suggests that although the token economy was used as an intervention to reduce undesirable behavior, the study did not establish a statistically significant effect on the learners' behavior.

4. Using Positive Reinforcement to Increase Student Engagement in the Classroom	Aljohani, M. (2023).	Thematic Area: Teaching and Learning Focus: Instruction Context: A quantitative action research study assessing the effectiveness of natural, social, and token reinforcements on classroom engagement.	Problem: Students displaying off-task behavior and lacking motivation to participate academically. Action: The teacher applied Skinner's operant conditioning by introducing desirable stimuli (verbal praise and tokens) immediately after positive behavior. Outcome: The intervention successfully reshaped the classroom environment, drastically improving student motivation, peer collaboration, and attentiveness.
5. The Impact of Positive Reinforcement on Student Behavior	Esi, N. (2025).	Thematic Area: Teaching and Learning Focus: Instruction Context: Action research investigating how verbal praise, tangible rewards, and group recognition shape classroom behavior.	Problem: Disruptive actions breaking classroom harmony and distracting students from constructive activities. Action: Shifted classroom management to reward desired behaviors (active participation, collaboration) with immediate verbal praise and tangible rewards. Outcome: Resulted in a 50% increase in positive behaviors. 85% of students reported feeling significantly

			more motivated when their actions were recognized.
6. Achieving Improved Learning Outcome and Promoting Positive Discipline Using Reinforcement-Based Teaching Strategy	Alipio, J. (2019), DepEd E-Saliksik (2018). (Local Source)	Thematic Area: Teaching and Learning Focus: Learners Context: A localized Philippine action research aligned with DepEd's mandate on positive discipline, emphasizing reinforcement over punishment.	Problem: The need to establish classroom discipline without resorting to punitive measures, which often discourage learners. Action: Implemented a reinforcement-based teaching strategy utilizing positive discipline to correct behaviors. Outcome: Showed that strengthening positive reinforcement successfully improved both learning outcomes and the overall disciplinary climate in the classroom.
7. Reducing Student Tardiness Through Strategic Reward System: An Action Research	Austria, E., Cagang, E., Olandria, J.(2019) (DepEd E-Saliksik (2018). (Local Source)	Thematic Area: Teaching and Learning Focus: Learners Context: A Philippine action research exploring strategic reward systems to correct specific negative student habits (tardiness) using positive discipline.	Problem: Chronic student tardiness negatively impacting both the individual student's learning and the class momentum. Action: Instituted a strategic reward system offering positive reinforcement to students who demonstrated punctuality. Outcome: Successfully reduced tardiness rates, proving that

			positive discipline and rewards are highly effective in modifying specific negative habits
8. Research-based Effective Classroom Management Techniques	Stueber, A. (2019)	Thematic Area: Teaching and Learning Focus: Instruction Context: Applied action research analyzing different classroom management theories to reduce disruptive behavior and maximize success.	Problem: Ineffective classroom management strategies causing educators to lose control of the learning environment. Action: Combined theoretical analysis with practical implementation of proactive, reinforcement-heavy management techniques. Outcome: Concluded that shifting from reactive discipline to proactive positive reinforcement yields the greatest student and educator success.
9. Does Token Economy Behaviour Modification Affect Young Children's Negative Behavior?	Solehudin, H., Darmayanti, R. (2018)	Thematic Area: Teaching and Learning Focus: Learners Context: Descriptive qualitative action research exploring the direct impact of a token economy system on negative behavior modification.	Problem: High frequency of negative behaviors (e.g., inattentiveness, disruption) hindering the educational process. Action: Implemented a targeted token economy system to systematically modify and correct negative behavior. Outcome: The token economy successfully

			decreased the occurrence of negative behavior by replacing it with incentivized positive habits.
10. A systematic evaluation of token economies as a classroom management tool for students with challenging behavior	Maggin, D. M., Chafouleas, S. M., Goddard, K. M., & Johnson, A. H. (2017)	Thematic Area: Teaching and Learning Focus: Learners Context: A systematic meta-analysis of 24 school-based, single-case experimental studies targeting primary and secondary school learners with chronic disruptive and challenging classroom behaviors.	Problem: Persistent classroom disruptions and off-task behaviors resist simple verbal warnings, frequently leading to lost instructional time and disciplinary escalation. Action: Schools instituted structured token economy systems where students earn points, tickets, or tokens contingent upon demonstrating targeted prosocial classroom behaviors, which are later exchanged for backup reinforcers (privileges, activities, tangibles). To ensure consistency, educators clearly defined measurable behavioral targets, displayed visual tracking charts in the room, and maintained predictable exchange schedules. Outcome: The token systems produced moderate-to-strong empirical effects in suppressing disruptive behaviors, increasing task completion, and stabilizing classroom decorum across diverse grade levels.

ACTIVITY 2: Read and analyze the guide questions below. Write your answers in column B.

Guide Questions:	
1. What did you notice about the titles of the action research? What are the common problems to be solved?	The titles consistently highlight proactive behavioral interventions, featuring keywords like "Token Economy," "Reward System," and "Behavior-Specific Praise". The common problems addressed across these studies are low learner motivation, short attention spans, and the frequent occurrence of minor disruptive/noncompliant behaviors that steal valuable instructional time.
2. What are the common solutions proposed in the problem?	Rather than relying on punitive measures, the common solutions revolve around proactive, positive reinforcement. The studies propose implementing Token Economies (using points, stars, or physical tokens) paired with Behavior-Specific Praise (BSP) to systematically incentivize and reward on-task behavior and active participation.
3. What do you think about the intention of the teacher-researchers in conducting the research?	The teacher-researchers clearly intend to reclaim lost instructional time by shifting the classroom culture from reactive discipline (punishing mistakes) to proactive management (rewarding positive habits). Their goal is to create a structured, supportive learning environment where students are intrinsically and extrinsically motivated to sustain focus—a crucial necessity for technical and laboratory-based subjects where pacing and attention to detail are required.
4. What significant ideas or concepts did you learn from the activity?	As a future educator, conducting action research is an essential means of further developing ourselves and establishing the practice of lifelong learning. As time passes, changes in society also continue to occur, including changes in trends, problems, and possible solutions. As society's demand for highly capable individuals continues to increase, we, as educators, must prepare these learners by guiding them toward the paths they may choose and encouraging them to overcome the challenges of learning. Through action research, we are able to utilize our observations and transform them into action plans

	that allow us to address the gaps we identify in the school, teaching practices, instruction, curriculum, and among learners. In doing so, we can help students move closer to achieving their aspirations while also contributing to the improvement of the school system through the integration of appropriate interventions.
5. What do you think would be the benefit of conducting action research in your career as future educator?	The significant concepts we learned from the activity were questioning, identifying gaps, and critical thinking. Starting with questioning, this concept enables us, as researchers, to reflect on the areas we observe and examine them more deeply. This leads us to understand the importance of conducting research, identify the focal participants and possible benefits, determine the appropriate application of an intervention, and consider other important factors. This then led me to understand the importance of identifying gaps. As we continued asking questions, we were able to identify problems that we wanted to address. Although the concept of a token economy is commonly discussed, its application and effectiveness may vary depending on the situation and context. This further encouraged us to investigate its effectiveness and potential impact on learners. Lastly, critical thinking was an important concept in this research activity. We were challenged to find related literature online, and with the rise of misinformation and fake documents, it is important to know how to determine whether a study is an actual published paper. For example, we can verify a study by checking its DOI or using trusted academic websites and databases. Additionally, by carefully examining the research articles we find, we must determine their relevance and significance to our research topic, as well as examine their applications, limitations, and recommendations. These practices will further help us in conducting our own study.
